

Strange Grid Again

A strange grid has been recovered from an old book. It has 5 columns and infinite number of rows. The bottom row is considered as the first row. First few rows of the grid are like this:

```
.....  
.....  
20 22 24 26 28  
11 13 15 17 19  
10 12 14 16 18  
1 3 5 7 9  
0 2 4 6 8
```

The grid grows upwards forever!

Your task is to find the integer in c^{th} column in r^{th} row of the grid.

Input Format

There will be two integers r and c separated by a single space.

Constraints

- $1 \leq r \leq 2 * 10^9$
- $1 \leq c \leq 5$

Rows are indexed from bottom to top and columns are indexed from left to right.

Output Format

Output the answer in a single line.

Sample Input

```
6 3
```

Sample Output

```
25
```

Explanation

The number in the 6th row and 3rd column is 25.
